

THE CROCODILE

Not to be taken literally, the 'brooding crocodile' (or dragon) takes a mythical form to unveil the relationship of occurrences from deep below the Earth's crust to that which can be experienced above. Not only is there life on the Earth's surface and its own responses to seasons and cycles, but the soil, the bedrock below carries its own life force. The earth trembles, bleeds and scars, shifts and sinks, the mountains are heaved into existence and for all their imposing appearance, eventually succumb to the wear of time.
